

What they look like:

Orangutans display as much variety in their appearance as people do.

- The color and length of each one's hair is different.
- The shapes of their faces are different.
- And they have many different personalities.

There is no doubt about it -
Every orangutan is unique!

Like humans, orangutans can be identified by their fingerprints but their prints cannot be mistaken for a person's. Orangutan fingerprints are more pointed.

Male

Female

Male orangutans are about twice the size of females, weighing up to 200 pounds and reaching a height of about 5 feet.

CHEEK POUCHES

When males are about 15 yrs old, they begin to develop large cheek pads which female orangutans apparently find very attractive.

Cheek pads are made of fatty tissue and make the males look larger and therefore more powerful.

They may also help to project their "long call" through the forest - much like when a person cups his hands around his mouth when he yells something.

Humans and orangutans are both omnivores (eat both plants and animals) but orangutans are **mostly herbivorous** (plants comprise most of their diet).

With strong jaws and heavy back teeth, orangutans can crush tough foliage and can crack even the hardest nuts.

TRUE OR FALSE?

Like humans, orangutans have 32 teeth.
